

RevApp

## INFO SHEET

**RevApp** is a lightweight review and approval tool that fully concentrates on the key features of that process. It's easy to use but still provides the most common features needed to do the job in an efficient way.

It provides a role based user management for internal users and fine granular access right options for external reviewers to the review jobs. You can organize your work in so called namespaces that encapsulate users, groups, jobs and preference settings from other namespaces, giving you the opportunity to strictly divide working groups from each other. The review jobs are automatically being created during the upload of a video file.

**RevApp** provides two visualization options of the jobs. These jobs can be structured in folders to provide another level of organization. The actual review process can be done in a detail view, where reviewers can see the video file in a modern html video player. This player provides all navigation options up to single frame jumps to empower the reviewer to find even the most hidden mistake. Comments can be placed with in- and optionally with outpoints to the timeline. Finally, the approval state can be assigned.
